FSH	52.95	mIU/ml	Follicular phase : 3.4 - 12.4 Ovulation phase : 4.5 - 21.3 Luteal phase: 1.6 - 7.5 Postmenopausal stage: 25.5 - 134.5 High FSH levels in women may be present: - During or after menopause, including premature menopause - When receiving hormone therapy - Due to certain types of tumor in the pituitary gland - Due to Turner syndrome Low FSH levels in women may be present due to: - Being very underweight or having had recent rapid weight loss - Not producing eggs (not ovulating) - Parts of the brain (the pituitary gland or hypothalamus) not producing normal amounts of some or all of its hormones - Pregnancy
LH	50.27	IU/L	Follicular phase: 2.4 - 12.7 Ovulation phase: 14.2 - 95.7 Luteal phase: 1.0 - 11.5 Postmenopausal phase: 7.9 - 58.8 In women, a higher than normal level of LH is seen: - When women of childbearing age are not ovulating - When there is an imbalance of female sex hormones (such as with polycystic ovary syndrome) - During or after menopause - Turner syndrome (rare genetic condition in which a female does not have the usual pair of 2 X chromosomes) When the ovaries produce little or no hormones (ovarian hypofunction) A lower than normal level of LH may be due to the pituitary gland not making enough hormone (hypopituitarism).
Prolactin	12.52	ng/ml	4.81-23.4
Following conditions may have high prolactin levels: - Chest wall injury or irritation - Presence of nipple rings - Disease of an area of the brain called the hypothalamus - Thyroid gland does not make enough thyroid hormone (hypothyroidism) - Kidney disease - Pituitary tumor that makes prolactin (prolactinoma) - Other pituitary tumors and diseases in the area of the pituitary - Abnormal clearance of prolactin molecules (macroprolactin) - Certain medications
