Interpretive Data

- i1: eGFR
eGFR is calculated according to CKD-EPI Creatinine Equation. (For Afro-Caribbean, multiply results by 1.159)
- i2: NT pro-BNP
NT-pro-BNP values below 125 pg/mL exclude cardiac dysfunction with a high level of certainty in patients with symptoms suggestive of heart failure, e.g. dyspnea. In acute setting the value below 300

Interpretive Data

i8: Vit D

Please note the change from population based reference range to clinical decision values.
Clinical decision values correlate better with clinical status of Vitamin D.

<12 ng/mL – Deficiency

12 – 19 ng/mL – Insufficiency

>=20 ng/mL – Optimum Values

i9: TSH

As per ATA guidelines 2017, for the typical patient in early pregnancy the **TSH upper reference limit is 4.0mIU/L** and the lower limit of reference range is significantly lower than the non-pregnant reference range.

i10: FT4

For patients on thyroxine therapy, therapeutic levels for FT4 may be slightly higher than reference intervals of normal population. However TSH should be the guide for maintenance of therapy.
